Peaches.-The 2940 schedule called for a separation of clingstone and freestone peaches in Arizona and California. However, California is the only State where the separate totals of each type are of special interest. Accompanying table 5 shows this breakdown for the two States concerned.

Pears. - In accordance with the unit of measure thost widely used in each region, the 1939 pear production was reported in tons in Arizona and California, and in bushels in all other states. The 1934 production of this iruit in California and the 1929 production in Callfornia and selected counties in Arizona, Idaho, oregon, and Washington was also carried in tons. The production figure, when published in the general summary tables in 1930 and 1935, was converted to bushels for these States using the conversion factor of 56 pounds per bushel. Recent investigation indicates that the weight per bushel of pears should be 50 pounds. For the current summary table, this weight has been used in converting the 1939 production from tons to bushels and in recomputing the production for the years 1929 and 1934.

For pears, as for peaches, a breakdown into two groups was asked for-Bartlett pears and pears other than Bartlett. In addition to Arizona and Callfornia, this separation was asked for in Idaho, Nevada, Oregon, Utah, and Washington. Table 6 shows this breakdown.

${ }_{2}^{1}$ Farms reporting trees, April 1, 1940, or production, 1939.
${ }^{2}$ Tons (fresh fruit basis).

Plums and prunes. -Production for these fruits was carried in three units on the 1940 schedule, depending upon the most usual unit of measure for the region concerned. In Region 8 (Idaho, Nevada, Oregon, Vtah, and Washington) this fruit was reported in pounds, fresh weight. only in Region 9 (Arizona and California) were plums and prunes separated. In Region 9, plums were carried in tons fresh weight and prunes in tons dry weight. All other regions reported plums and prunes in bushels, fresh weight. The accompanying table 7 gives data for plums and prunes in Arizona and California where the separation of these fruits was made.

To obtain a common unit for the United States Summary, all production was converted to bushels, fresh weight. In converting prune production in Arizona and California from dry weight to fresh welght, the reported production was multiplied by 2.5 . The weight of 56 pounds per bushel was used in converting to a comraon unit.
