CHAPTER II—SIZE OF FARMS

Introduction.—Statistics are given in this chapter on the number of farms, land in farms, land uses, and value of farms (land and buildings), classified on the basis of the total land area in each farm. Farms, under the Census definition, include operations which are conducted on areas varying in size from a few thousand square feet or less to hundreds of thousands of acres. The small farms include such places as village lots on which gardening, poultry-keeping, or other activity, barely meet the minimum requirements to be classified as farms. They also include highly specialized agricultural operations such as greenhouses, mushroom cellars, broiler plants, and feed lots. Typical of the extremely large holdings are stock ranches in the West and Southwest.

The statistics presented herein represent one approach for measuring the relative importance and characteristics of farms of varying sizes. Other measures of the size of operations, for which data are presented in this volume, include: the number of farms arrayed according to the total value of gross farm income (see chapter X, Value of Farm Products, and Type of Farm); number of farms by acres of cropland harvested (included in this chapter and in chapter I); number of farms by value of farm implements and machinery (see chapters I and VI); number of farms by amount of cash wages paid (see chapter V); and number of farms by number of tractors (see chapter VI). Additional items have been classified, by size of farm, for a sample of the farms enumerated in the 1945 Census. These data are included in a separate report.

The size-of-farm data shown in this chapter represent totals for the United States, regions, divisions, and States. Overall totals for the number, acreage, and value of farms, as of the census date, and the farm acreage classified according to use for the preceding calendar year are presented in chapter I. Data for these items, by color and tenure of farm operator, are presented in chapter III. This latter chapter also presents similar statistics for farms of various sizes in each color and tenure class.

Statistics collected in the 1945 Census are given, for counties, in volume I for number of farms, land in farms, cropland harvested, and value of farms (land and buildings) classified by size of farm. This volume also presents comparable data for 1940 for the number of farms. No data by size of farm, other than the average size of farm, are available for minor civil divisions (townships, precincts, etc.).

AVERAGE SIZE OF FARMS, FOR THE UNITED STATES:

1850-1945

ACRES

Size-of-farm classification.—The size classification used in the 1945 Census tabulations takes into account the measurements commonly established by government land surveys.

It avoids, to a great extent, bimodal distributions of acreages within the established class intervals. This classification is particularly appropriate in those survey areas where the farms are made up of fractions or multiples of the government survey section of 640 acres. Thus, in the present classifications, farms of 20, 40, 60, 120, 160 acres, etc., fall at midpoints of the class intervals. This classification was introduced in 1935. A more detailed discussion of this grouping, in comparison with the grouping used in prior censuses, together with an analysis of data for representative survey and nonsurvey counties, is found in chapter II, volume III of the 1935 Census of Agriculture Reports.

The size classification established in 1935 provided for 17 principal size groups with a further division of two of the groups to provide exact comparisons with the classifications used in prior censuses. Thus, the 10-to-29-acre group was subdivided to show farms of 10 to 19 acres and 20 to 29 acres and the 140-to-179-acre group was subdivided to show farms of 140 to 174 acres and 175 to 179 acres.

The use of these subgroups was repeated in 1940, thus providing comparability with the old grouping for another census. These subgroups were not used in the 1945 Census tabulations. When 1930 and earlier figures are presented in comparison with the 1945 data, the 1940 and 1935 figures are shown for both the old and the new groupings.

In the 1935 classification, the largest farms were tabulated in the group "10,000 acres and over." This group, although representing less than 0.1 percent of the number of farms, accounted for approximately 12 percent of the total land in farms. To provide further information as to the range in size of the large farms, the "10,000 and over" group was further classified into seven subgroups in the 1945 Census tabulations. A supplementary tabulation of the 1940 returns for farms of 10,000 acres and over, published for the first time in the reports of the 1945 Census, provides comparable data for that year.

Table 1.—FARMS CLASSIFIED BY ACRES OF IMPROVED LAND, FOR THE UNITED STATES: 1870 AND 1880

¹Not available.

¹For 1880, the classification by acreage of improved land is for "Farms containing 3 acres and more." The number of farms in the various classes adds to 1,955,014 which is 89,063 less than the total number of farms.

Tabulations of farms classified on the basis of the total land area in the farm have been made for each census beginning with 1880. The classification used in 1880 consisted of eight size groups. Tabulations of farms by size were also made in the Censuses of 1880 and 1870, but the classification was based on the acres of "improved" land in the farm rather than on the total acres. Such a classification is not comparable with that used in subsequent censuses. The United States figures for the number of farms by size (based on improved land) are shown in table 1 for 1860 and 1870.

For each census beginning with 1900, the size-of-farm classification has included, in addition to a count of farms, a tabulation of all land in farms, the more important classes of land according to use, and the value of farms, with the exception of the value of farms for the 1935 Census. For both the

CENSUS OF AGRICULTURE: 1945

PERCENT DISTRIBUTION OF THE NUMBER OF FARMS, BY SIZE, BY STATES: 1945

1945 and 1940 Censuses, the entire land-use classification was tabulated by size of farm. A cross classification of farms by size and tenure is available for 1945, 1930, and 1925. In censuses prior to 1945, size-of-farm classifications have usually included one or more of such additional items as the value of buildings, the value of the dwelling of the farm operator, the

value of implements and machinery, the value of livestock, the number of specified classes of livestock, and the number of farms by type of farm. In this chapter statistics for previous censuses are shown only for those items for which comparable data were tabulated for all farms in the 1945 Census.

Definitions and explanations.—The definitions herein are limited to those items for which statistics are presented. Only a brief description is given for each item. (For more complete information, refer to chapter I and to the facsimile of the 1945 Farm and Ranch Schedule shown in the Appendix to this volume.) The explanations refer principally to the 1945 Census of Agriculture, but, in general, they are also applicable to earlier censuses. Attention is called to significant differences between one census and another.

A farm, for Census purposes, is all the land on which some agricultural operations are performed by one person, either by his own labor alone or with the assistance of members of his household, or hired employees. A farm may consist of two or more separate tracts not necessarily adjacent. When a landowner has one or more tenants, renters, croppers, or managers, the land operated by each is considered a farm. Thus, on a plantation the land operated by each cropper, renter, or tenant is a separate farm. Tracts of less than 3 acres are farms only if their agricultural products for the calendar year preceding the census date were valued at \$250 or more.

Land in farms includes all land owned or leased by the farm operator, including considerable areas of land not actually under cultivation and some land not even used for pasture or grazing, but all such land must have been under the control of the operator and must have been considered a part of his farm. Land grazed under permit is excluded, likewise any sizable tract of timberland or other nonagricultural land held as a separate business and not used for pasture or grazing.

Farm land, classified according to use in 1944, includes—

Cropland harvested.—Land from which crops were harvested or from which hay was cut or land in orchards in 1944.

PERCENT OF ALL LAND IN FARMS REPRESENTED BY CROPLAND HARVESTED, BY SIZE OF FARM, FOR THE U.S.: 1945 AND 1940

Crop failure.—Land on which all crops (except orchards) were a complete failure in 1944.

Cropland, idle or fallow.—Cropland idle, in summer fallow, or in soil improvement crops only in 1944.

Cropland used only for pasture.—Land used only for pasture or grazing in 1944 that was plowed within past 7 years.

Woodland pastured.—All farm wood lots or timber tracts, natural or planted, and cut-over land with young growth, which had or would have value as wood or timber, which were pastured or grazed in 1944.

Pasture other than cropland and woodland.

Woodland not pastured.—All farm wood lots or timber tracts not pastured or grazed in 1944.

All other land.—Includes all wasteland, house yards, barn-yards, feed lots, lanes, roads, ditches, etc.

In addition to these eight classes of land, the tables also present data for 1944 for four summary classifications, which are somewhat overlapping, as follows:

SIZE OF FARMS

59

Total cropland.—Cropland harvested; crop failure; cropland, idle or fallow; and cropland used only for pasture.
Land used for crops.—Cropland harvested and crop failure.
Total pasture.—Cropland used only for pasture, woodland pastured, and pasture other than cropland and woodland.
Total woodland.—Woodland pastured and woodland not pastured.

Table 2.—NUMBER OF FARMS UNDER 3 ACRES IN SIZE, PERCENT OF ALL FARMS, MINIMUM VALUE OF PRODUCTS, AND INDEX NUMBERS OF PRICES RECEIVED BY FARMERS, FOR THE UNITED STATES: 1880 TO 1945

¹Not available.

¹From "Agricultural Statistics, 1945," table 571, United States Department of Agriculture. For 1910, the index number is for that calendar year. For all other years, each index number is for the calendar year preceding the census date. Series revised in 1944.

²"Or requiring for its agricultural operations the continuous services of at least one person."

³No minimum limit used in the 1900 Census on value of products. All agricultural establishments with less than three acres were reported as farms whenever their operation or management required the constant services of at least one individual.

⁴Value of products sold.

Items for earlier censuses which are not strictly comparable with those shown for the 1945 Census are shown below:

Plowable pasture, for 1924 to 1939, includes land used only for pasture or grazing which could have been used for crops without additional clearing, draining, or irrigating and differs from cropland used only for pasture for 1944 in that it includes land which may not have been plowed within 7 years preceding the census date.

Pasture other than plowable and woodland, for 1924 to 1934, differs from "pasture other than cropland and woodland" for 1944 in the same absolute amount that "plowable pasture" differs from "cropland used only for pasture." Data are not available for 1939.

Land available for crops, for 1924 to 1939, includes cropland harvested; crop failure; cropland, idle or fallow; and plowable pasture.

Improved land, for 1850 to 1920, in general, included land regularly tilled or mowed, land in pasture that had been cleared or tilled, land lying fallow, land in gardens, orchards, vineyards, and nurseries, and land occupied by buildings, yards, barnyards, etc.

Farms reporting.—The number of farms for which a specific item was reported. For example, of the 7,152 farms of 10,000 acres and over in the United States in 1945, only 4,403 reported a crop of some kind harvested in 1944. If enumerators obtained complete reports, the remaining 2,749 farms in this size group harvested no crops in 1944.

Value of farms (land and buildings).—The market value of the real estate represented in the farm. Enumerators were asked to obtain from the farm operator his estimate of the current market value of the farm he was operating.

Comparability of data.—The statistics for farms in some size-of-farm groups are affected by Census definitions and procedures to an even greater extent than are the over-all totals. (See discussion of "Comparability of data" in chapter I.) Of particular significance are farms which were marginal in respect to the minimum requirements under the Census definition of a farm. For each census for which data have been tabulated by size of farm, the definition has specified that places of less than 3 acres were not to be enumerated as farms unless they met certain criteria as to value of products or, as in the 1910 Census, labor requirement. The number of farms in this size group has varied greatly from census to census. However, this group has been relatively unimportant numerically. In 1945, although more than twice as numerous as at any previous census, farms of less than 3 acres represented only 1.7 percent of the total number of farms. Table 2 presents the number and proportion of farms of under 3 acres for each census from 1880 to 1945 (except 1890, when farms of under 3 acres were not tabulated separately) and the criteria used in each census for determining the inclusion of places as farms. Since the requirements generally included a minimum value of products, index numbers of prices received by farmers, as published by the United States Department of Agriculture, are included to show that, as a result of changes in price level, there have been changes in the amount of produce required to meet the minimum requirements for a farm even when there has been no change in the specified value of products. The index numbers indicate that operations qualifying as farms in the 1945 Census, with a value of products at or near the minimum of \$250, would not have qualified as farms in any of the earlier censuses except that of 1920.

In addition to the effect of price level, the number of farms with limited agricultural operations was also influenced in 1945 by war conditions which greatly encouraged small-sized agricultural operations through the patriotic appeal for victory gardens and the obvious advantages, under a rationing system, of producing foods for family use.

Although the minimum requirements of a farm in respect to the extent of the agricultural operations were specified only for farms of under 3 acres, they may have influenced, to some extent, the enumeration of places of 3 acres and over. Farms with limited agricultural production are not limited to those of under 3 acres. This is indicated by the tabulations of farms by total gross farm income (value of products sold or used by farm households) which are presented in chapter X. In 1945, there were 453,580 farms for which the gross products in 1944 ranged from \$1 to \$249 and, in addition, there were 98,673 farms for which no products were reported as sold or used by the farm household. As there were only 98,966 farms under 3 acres in size, which number included many highly specialized operations, such as greenhouses, nurseries, mushroom cellars, hatcheries, and the like, most of the low income farms must have been 3 acres or more in area. It is probable that a large number of the farms having limited operations were under 10 acres in size, although many larger tracts also had limited agricultural operations. Table 3 presents United States totals for the number of farms of under 10 acres, as reported for the various census years, with separate totals for farms of under 3 acres and farms of 3 to 9 acres.

Changes in the procedure of enumerating Indian reservations affected the statistics by size of farm in a number of instances, particularly in Arizona and New Mexico. In the 1945 Census, if land in an Indian reservation was used by the Indians on a cooperative basis, the entire acreage was reported as a single farm, with no attempt made to segregate the individual operations. However, individual returns were obtained when the Indians carried on their agricultural activities as independent operations. In previous censuses, as a general rule, an attempt was made to obtain returns for each Indian whose agricultural production was sufficient to meet the minimum requirements of a farm, with a reservation return to account for acreage used for agricultural purposes that was not allotted or assigned to Indians or not leased to others. Under these circumstances, the returns for the individual Indians often represented a more or less arbitrary assignment of acreage, or the operations were reported with "no land owned or leased." (See table 5.) Procedures varied from one reservation to another and results were not always comparable from one census to another.

CENSUS OF AGRICULTURE: 1945

Comparability, especially for the larger farms, has been affected by changes in the administration and management of range lands which have brought under the control of individual operators increasing acreages of grazing lands which were formerly open range. Much of the 60,509,808 acre increase between 1940 and 1945 in land in farms in the West may represent such land. Nearly all of this increase (58,864,226 acres) occurred in farms of 10,000 acres and over. Individual returns for the two years indicate that additional acreages of grazing land are being leased from the Federal Government, from the various States, and from railroads, oil companies, lumber companies, cattle and land companies, etc.

Statistics by size of farm were also affected by the somewhat more rigid procedure followed in 1945 to exclude large tracts of nonagricultural lands from the Census reports; by lack of uniformity in the enumeration of citrus groves, pecan orchards, and other collectively developed operations because of difficulty in determining whether each ownership tract represented a farm or whether many tracts under one management represented a farm; and by the procedure followed in enumerating farms with acreage in two or more counties whereby the entire acreage was credited to one county. This procedure for enumerating cross-line acreage particularly affected statistics by counties. Thus, in 1945, but not in earlier censuses, a number of cropper and tenant farms were credited to the county in which the multiple-unit headquarters was located rather than to the county where these small cropper and tenant tracts were located. Some of the increases in the number of large farms may have resulted from emphasis in 1945 on the enumeration of large farms. This emphasis tended to secure over-all returns for operations which previously may have been returned separately. (See chapter I for a more complete discussion of comparability of data.)

Presentation of the statistics.—The statistics are presented to provide an over-all picture for the United States, followed by information for different sections of the country and the several States. The data are arranged to facilitate comparison of one section, or one State, with another. Averages, percentages, and other derived data are provided as aids in interpreting the statistics. Some of the derived data do not appear in the tables that carry the base figures. Comparable data from earlier censuses provide a measure of changes that have occurred from census to census. Data for earlier years are restricted to items classified by size in the 1945 Census, except for certain specified classes of farm land not strictly comparable with the 1945 classification. All such comparative data are shown for the United States. Only historical data for selected census years or for selected items are shown by States.

The tabular presentation of the data consists of 16 tables. Tables 1 to 10, inclusive, present summary data for the continental United States, and tables 11 to 16 present data by regions or divisions and States. In the division and State tables, the States are arranged in geographic order to facilitate comparisons among States in the same general area. An outline map showing the States and the geographic divisions and regions for which totals are shown appears in the Introduction to this volume.

Some of the tables provide for ready comparison of the 1945 Census data for selected items while others bring together figures for several censuses. Thus, the same data may be found in several tables, depending upon the objective of the particular table. In general, the United States, or summary, tables permit the bringing together of more related data and the showing of more historical and derived data than is practicable in the division and State tables.

Summary table 5 presents, by States, a count of agricultural operations for which no land was reported as owned or leased. In the other tables, this "0" acre group of farms is included in the size group "under 3 acres." These "0" acre farms consist for the most part of operations limited to livestock on open range, although they also include some apiaries or bee farms. Operations requiring only limited areas for buildings only, such as greenhouses or hatcheries, when covering less than 1 acre, were always given a nominal acreage of "1". Enumerators were instructed to include agricultural operations similar to those of 4-H Club members and hired help

In the return for the farm on which the operations were conducted. The number of farms with no land owned or leased amounted to only 268 in 1945 and 489 in 1940. The difference in the method of enumerating Indian reservations accounted for most of the decrease. In 1940 there were 257 Indian operations in Arizona reported as having no land owned or leased. In 1945 most of such operations were included in reservation returns for cooperative groups. Prior to 1940, farms with no land owned or leased were given a nominal acreage of "1" and were included in the size group "under 3 acres."

Supplementing the tabular presentation, there is a series of eight dot maps which show the geographic distribution of farms of various sizes. These maps were prepared on a county-unit basis. Cross-hatch maps, also prepared on a county-unit basis, show the geographic variation in the average size of farms and a distribution of the number of farms of less than 50 acres as a percent of all farms. A number of bar charts present, for the United States as a whole, a graphic picture of the historical changes in the number of farms and land in farms by size of farm. Another chart shows the percent distribution of the number of farms in various size groups by States.

Changes in size of farms.—The outstanding changes in size of farms shown by the 1945 Census of Agriculture were: (1) a large increase in the number of very small farms representing, for the most part, very limited agriculture operations with production primarily for home use, (2) a consolidation of small family-sized farms into somewhat larger operating units which permitted greater and more efficient use of machinery and manpower, and (3) increases in the number and in the size of operations of large commercial farms.

The foremost change in size of farms was the increase of 88,159, or 17.4 percent, in the number of farms of under 10 acres. This change, for the most part, represents places or operations included for the first time in a census of agriculture rather than a reduction in the size of operations. Many of these operations qualified as farms, under the Census definition, only as a result of a higher price level. These farms, in general, represent operations which supplement other sources of livelihood. A part of this increase represents the continuation of a trend, noticeable in previous censuses, toward part-time farming operations.

The increase in the number of farms of under 10 acres was noticeable in all areas. However, the greatest increases occurred in the Southern States. Of the total net increase for the United States, 85.9 percent was in the South.

The farms representing this large numerical increase added relatively little to the total agricultural production. Despite the increase in number, there was a decrease in total cropland harvested for farms of this size group.

Some of the increases in the number of small farms occurred in cash-crop areas, particularly the tobacco areas, because of crop-sharing arrangements offered as an inducement to keep labor on the farm. Thus, in the Carolinas, farms of under 10 acres increased by 22.7 percent. In this area there were also increases in the number of farms in all size groups up to and including the 30 to 49 group.

Another factor which tended to increase the number of farms, especially in the smaller size groups, was wartime conditions which encouraged the re-entry into production of farms which were previously idle. In the New England States, there

¹Land used only for pasture which had been plowed within 7 years.

²Land used only for pasture which could have been plowed and used for crops without additional clearing, draining, or irrigating.

³Cropland harvested; crop failure; cropland, idle or fallow; and cropland used only for pasture.

⁴Cropland harvested; crop failure; cropland, idle or fallow; and plowable pasture.

⁵Cropland harvested and crop failure.

was a general increase in the number of farms in practically all size groups. Farms of this kind have undoubtedly influenced the statistics in other areas, but the effect is not so noticeable because of other changes.

The most significant change in the size of farms was the increase in the size of those farms which are operated primarily by the farm family. In most areas there were large losses in the number of farms of less than the average size for the area, except for the very small farms previously discussed, and increases in the number of farms above the average size. For the United States as a whole, there were decreases in the number of farms in all size groups from 10 to 179 acres, representing a loss of 369,516 farms, as compared with a net loss of 237,630 farms for all size groups. For the most part, the acreages lost in these size groups were absorbed by other farms and account for much of the increase in the number of farms in the size groups above 180 acres.

This consolidation of farms into larger operating units continues a trend noticeable in previous censuses. With few exceptions, each census since 1880 has shown an increase in the average size of farms. The most noticeable increases were in areas best suited to the use of power equipment. In the West North Central States, the average size of farms increased from 251.6 acres in 1940 to 274.5 acres in 1945 and cropland harvested increased by 23.9 acres per farm. In the East North Central States there was an increase of 8.2 acres in average size and 9.0 in average acreage harvested. In the South, where there is greater dependence on hand labor, the average size of farms increased by 8.0 acres, while cropland harvested increased by only 1.2 acres.

In all areas, there were general increases in the number of large farms. There was an increase of 12,368, or 12.3 percent, in the number of farms of 1,000 acres and over. The land in these farms, however, increased by 95,937,055 acres, or 26.4 percent, and cropland harvested by 16,329,106 acres. These

farms, representing less than 2 percent of all farms, accounted for approximately two-fifths of the total land in farms and more than one-eighth of the total cropland harvested. The increase in land in farms in this size group exceeded the net increase for all size groups by 15,174,065 acres. Much of the net increase represents grazing lands in the Western States, some of which were previously open range. To this extent the increases do not represent actual changes in size of operations.

The number of farms of 1,000 acres and over increased in all but seven States. These States, except Arizona where the decrease in number was due to changes in the enumeration of Indian reservations, are all located in the East. Five of these States, although showing losses in total land for this size group, showed increases in cropland harvested. Only Tennessee showed decreases both in land in farms and in cropland harvested. However, the 500-to-999-acre group showed appreciable increases.

Farms of 10,000 acres and over, although constituting less than 0.02 percent of all farms, included 19.0 percent of the total land in farms. Only 246, or less than 4 percent of all farms in this size group, were east of the Mississippi and most of them were in the South.

The range in size in these farms of 10,000 acres and over, with comparisons for 1940, is shown by States in table 13. In this table, which presents numbers of farms only, farms in this size group are further classified by size into seven subgroups. The acreage and value figures for these subgroups are shown only for the United States as a whole in table 6.

The 262 farms of 100,000 acres and over represent an increase of 72.4 percent over the number in this size group in 1940. The land in these farms more than doubled. Nearly two-thirds of these farms were in Texas, Arizona, and New Mexico. Some of these extremely large farms represent grazing land having very low carrying capacity and therefore their area is not a true indication of their size of operations.

CENSUS OF AGRICULTURE: 1945

¹North Dakota and South Dakota admitted as States in 1889. Figures for 1880 obtained by consolidating data for the counties which then occupied the areas now known as North Dakota and South Dakota, respectively. The 1870 and 1860 figures are for Dakota Territory.

²In 1860 and 1850, Virginia included the area now known as West Virginia.

CENSUS OF AGRICULTURE: 1945

¹Land used only for pasture which had been plowed within 7 years.

¹ Land used only for pasture which had been plowed within 7 years.
² Includes wasteland, house yards, barnyards, roads, ditches, etc.

SIZE OF FARMS

91

CLASSES OF LAND ACCORDING TO USE, 1944, 1939, AND 1934; BY SIZE OF FARM: BY REGIONS AND STATES—Continued

Crop failure, 1944 (acres)	Cropland, idle or fallow, 1944 (acres)	Cropland used only for pasture, 1 1944 (acres)	Woodland pastured, 1944 (acres)	Pasture other than cropland and woodland, 1944 (acres)	Woodland not pastured, 1944 (acres)	All other land, 2 1944 (acres)	TOTAL CROPLAND, 3 1944		TOTAL PASTURE, 1944		Total woodland, 1944 (acres)	VALUE OF FARMS (LAND AND BUILDINGS) (DOLLARS)
