## FARM EXPENSES

As in other wheat regions machine hire was the highest in the subregions having the largest acreages per farm. (See tables 47, 48, 49, and 50.) Frequently operators of the larger farms own one or two combines but hire additional machines to speed up harvest. In the localities of high hail risk, the harvesting of wheat is completed as rapidly as possible. Some of the larger operators have found that they can hire the combining for less cost than if they operated their own machines.

Expenditures per crop acre for gas and oil may be expected to decline with a decrease in intensity of operation. However, only in subregion 105 is there a correlation between size of farm and the cost of fuel and oil per acre. Here the larger farms had considerably lower costs per crop acre than the smaller farms.

The amount spent per crop acre for hired labor was approximately twice as large in subregion 89 as in the other subregions. The amount spent per acre for hired labor was highest on the largest farms. This is to be expected for the operators of small farms do not have enough work to employ hired help.

Z Less than 0.05 cent.

Because of the decline in the importance of expenditures for hired labor, the total cost per crop acre for specified expenses decreases as the size of farm decreases in subregions 89, 90, and 91. However, the total cost per crop acre does not decline with the change in size of farm in subregion 105 where the lower hired labor per acre on the smaller farms is offset by higher costs for gas and oil.

The use of commercial fertilizer is not common except in the Red River Valley where about half the farmers reported its use (see table 51). In the other areas, less than 15 percent of farmers reported the use of fertilizer. The percentage of farmers in the lower-income groups who use fertilizer is very low. Probably many do not have the capital to buy fertilizer and others probably lack information on which to make a decision to adopt a relatively new practice. The higher percentage of older farmers in these groups may be related to the small percentage of farmers reporting the use of fertilizer. The rate of application reported is rather uniform among the economic classes in subregions 89 and 90. The use of commercial fertilizer in the other two subregions is not a common practice.
