

The largest farms have somewhat less income per total crop acre than the medium-sized farms but much more than the two groups of smaller farms. Here again, the small farms fail to use their resources as effectively as the larger farms, and total incomes are exceedingly small—less than one-third of the income per crop acre of the group.

The largest expense item is for feed, hired labor comes second (Table 62). Specified expenses per crop acre are much lower on the small than on the large farms. The large farms averaged but \$54 expenses per \$100 income, whereas the small farms averaged \$83.

Net income of these operators is not large. Production and sales of milk per cow are the lowest for any special dairy area (Table 63). The average price received per 100 pounds of milk is the highest of any area which indicates the type of market for fluid milk. Practically none is sold as cream. The quantity of whole milk used for manufactured dairy products is not known but the price received indicates that very little is used for other than fluid consumption. Alabama and Louisiana marketed 20 percent of the whole milk as manufactured products in 1954.

Some fertilizer was used by a larger proportion of the smaller farms than any other economic subregion, and the rate of application of those using fertilizer was higher (Table 64). Most of the farms used the same rate of application and only the two groups of farms at the extremes of the economic class showed much variation from the average.
