for many crops. Information on extent and level of fertilizer use provides important measures of changes in farm technology as well as a basis for projection of changes in crop yields and crop production.

The data in table 8 show the number of farms reporting fertilizer has decreased in each of the last four censuses. Much of this decrease is accounted for by the decrease in total farms.

The tonnage of fertilizer used on farms with sales of \$2,500 and over increased over 11 percent from 1969 to 1974. The quantity of fertilizer used in 1974 was 68 percent more than the amount used 15 years earlier and 37 percent more than the amount used 10 years earlier. In addition, sources other than census data indicate that the primary plant nutrient content of commercial fertilizer

has been increasing at a rapid rate during this time period. Census data show that much of the additional tonnage of fertilizer used was the result of the large increase in the acres of certain crops planted since 1969. Some of the largest increases were in field corn, wheat, soybeans, and cotton. Table 9 shows

changes in total tons used on farms with sales of \$2,500 and over since 1954.

The use of liquid fertilizer increased on farms with sales of \$2,500 and over in 1974 to 6.8 million tons compared with 5.5 million tons used in 1969. Table 10 presents the changes in tonnage used for these farms since 1959.
